

Solution Architect / Applied AI Engineer – Intern Task

Test tasks

Pick one. Budget 2–4 hours. Build it with Claude Code or Replit Agent. We want to see how you drive the tools, not how clever you are alone. Ship a public GitHub repo plus a live Replit URL or a 2-minute Loom showing it run.

1. Roast My GitHub

A web page where someone types a GitHub username and gets a friendly, accurate roast based on their public repos.

Must

- Fetch public repos via the GitHub API.
- Generate the roast with an LLM (Claude or your choice).
- Handle missing or private users gracefully.
- Deploy on Replit with a public URL anyone can open.

Bonus

- Let the user pick a roast style — corporate jargon, pirate, haiku, your call.

2. Receipt → Spreadsheet

Upload a photo of a receipt; get back a clean table of items, totals, and currency.

Must

- Vision model extracts vendor, date, line items, total.
- Display the result as a readable table on a web page.
- Show a graceful error if the image is unreadable.

Bonus

- Export the result as CSV with a single click.

3. Standup Whisperer

Dump messy notes about your day; get back a clean standup post (yesterday / today / blockers).

Must

- Any UI — web page, CLI, or Slack-style mockup.
- LLM produces consistent structure even on chaotic input.
- README shows the prompt you settled on and what you tried first.

Bonus

- Copy-to-Slack button with proper markdown formatting.

4. Wrong Answers Only

A quiz game where the LLM generates a question and four plausible-but-wrong multiple-choice answers. The user picks one and gets a witty explanation of why it is wrong.

Must

- User picks a topic; LLM generates the question and four wrong answers.
- No correct answer exists — that is the joke. The prompt must enforce this.
- Web UI, deployed live.

Bonus

- Score system stored in localStorage with a streak counter.

5. Recipe Remixer

Paste any recipe plus a constraint (vegan, halve it, 30-minute version, kid-friendly). Get back an adapted recipe with a "what changed" summary.

Must

- Recipe in, adapted recipe out, plus a short summary of changes.
- Handle a recipe that cannot be adapted (e.g. "make a steak vegan") with a useful response, not a crash.

Bonus

- Imperial ↔ metric conversion toggle.

What we look for

- Does it actually run from a fresh clone or Replit fork in under five minutes? (This is the biggest filter.)
- Clear README — how to run it, what it does, what you would do with more time.
- The Claude Code or Replit prompts you used, pasted in the README. Show your work.
- One thoughtful touch — error state, empty state, a nice loading message — something that shows you cared.
- Honest commit history. Do not squash to look slick; we want to see how you actually worked.

How to submit

Email careers@solution25.com with:

- Public GitHub repo link.
- Live Replit URL OR a 2-minute Loom of it running.
- Three sentences: what you built, what you would do next, what surprised you.
